

Under Covid

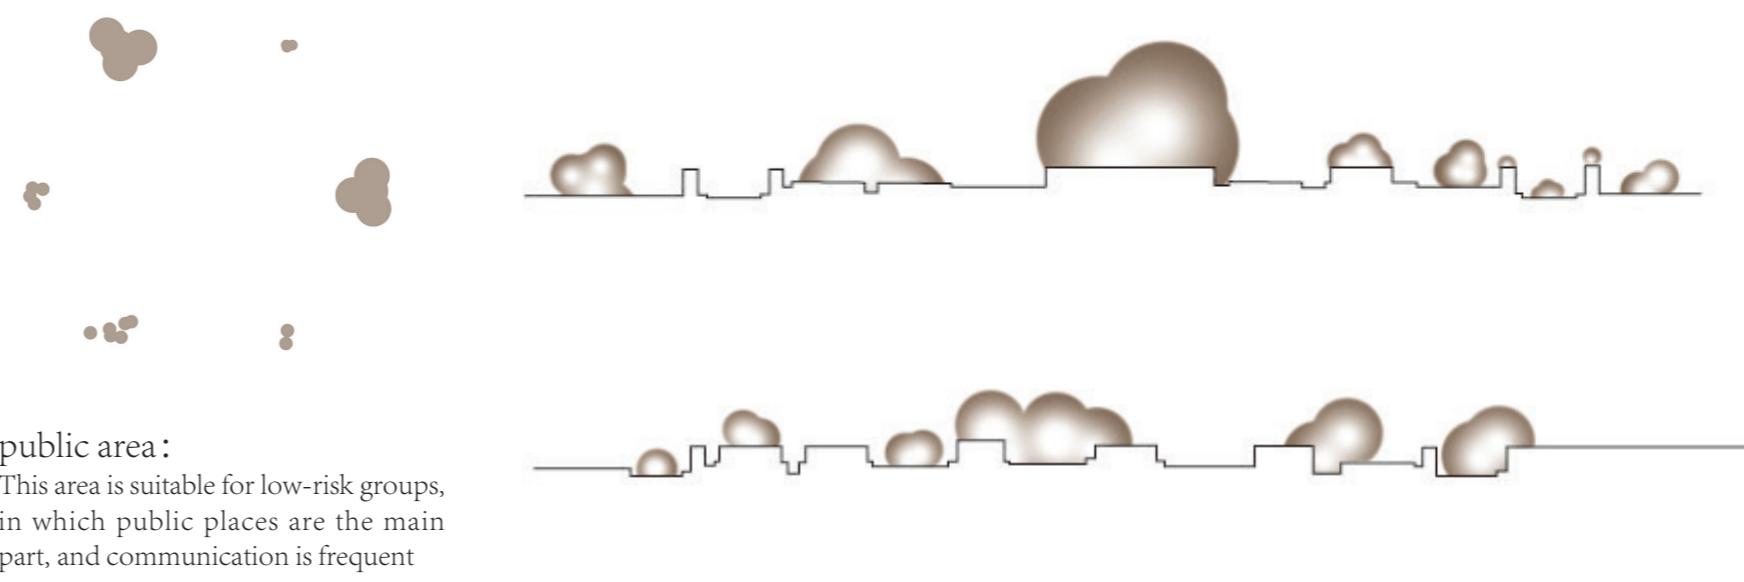

Site: Shanghai, China
Type: Individual Work

Because of Covid-19, people have to stay at home, the communication between people is less and less, in this project, I try to find a special social modes that is suitable for all kinds of social conditions. For the structure, I find out a changeble structure that could change the size of the space according to gravity.

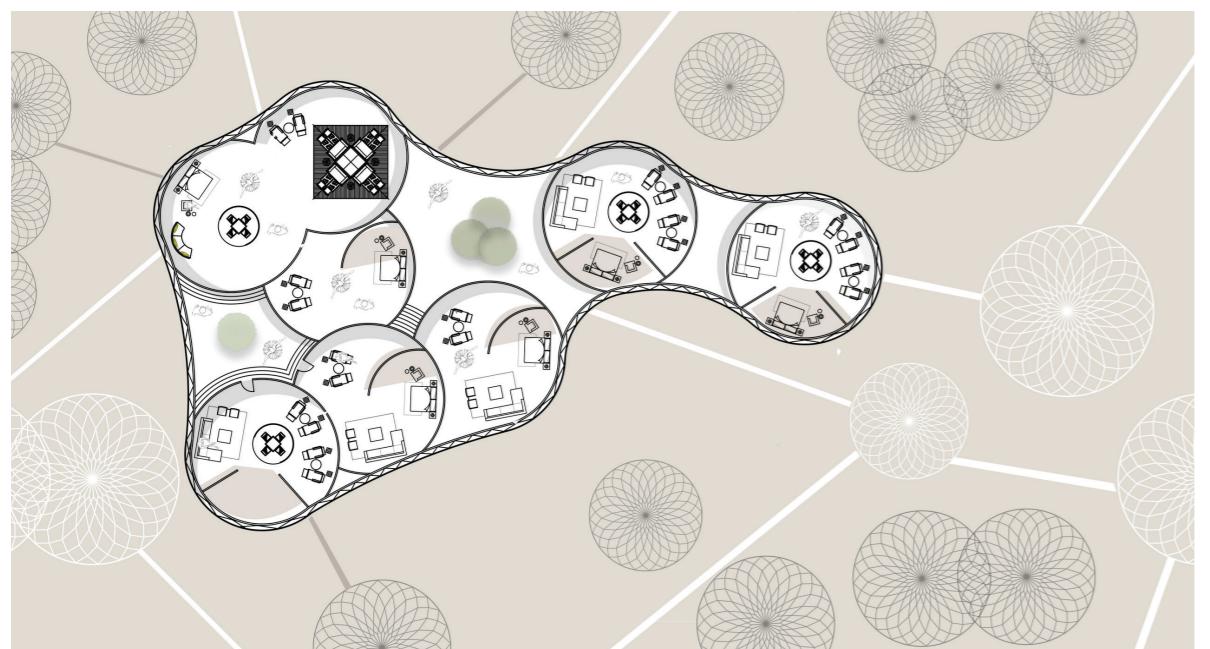

public area:

This area is suitable for low-risk groups, in which public places are the main part, and communication is frequent

semi-public area:

This area is suitable for the middle risk group, too much gathering social activities will not be allowed, the distance between people will be far away, and division will begin to occur

private area:

This area is suitable for high-risk groups. For the safety of themselves and others, people isolate their homes, and the large space is divided into small spaces, which aggravates the division
